

Ceiling light lamp LED

The LED lamp, is a product designed for public environments such as offices, lighting stations shelters, but also for the most stringent surroundings such as a railway tunnel, therefore it must have the characteristics of resistance to any weather conditions.

The advantage of these lamps compared to those of the traditional type (Neon), is that although the intensity of light comparable to them, they have a duration 10 times higher and also an absorption of power slightly lower.

The lamps can be installed where it's not possible to carry out constant maintenance.

Special attention will be placed in the ability to replace existing illuminated bodies (retrofit) with a minimal installation impact.

The requirements of these systems are essentially aesthetic for those for offices while those for tunnels will be characterized by a more robust architecture, as well as a high water resistance.
